COLUMBIA;
Raynal M., Grellet F., Laudie M., Meyer Y., Cooke R., Delseny M.
Submitted (OCT-1992) to the EMBL/Genbank/DDBJ databases.
-!- FUNCTION: THIS IS A 2S SEED STORAGE PROTEIN.
-!- SUBUNIT: THE MATURE PROTEIN CONSISTS OF A SMALL AND A LARGE LINKED BY DISULFIDE BONDS.
-!- SIMILARITY: BELONGS TO THE 2S SEED STORAGE ALBUMINS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Swaby I.K., O'Shaughnessy A., Rodriguez M., Hoffman J., Till S., Granat S., Shohdy N., Hasegawa A., Hameed A., Lodhi M., Johnson Chen E., Marra M., Martienssen R., McCombie W.R.; "Sequence and analysis of chromosome 4 of the plant Arabidopsis thaliana.";

MO1. Gen. Genet. 210:211-218(1987).
MO1. Gen. Genet. 210:211-218(1987).
-i- FUNCTION: THIS IS A 2S SEED STORAGE PROTEIN.
-i- PTM: IT IS POSSIBLE THAT THE 38 kDa PRECURSOR IS CLEAVED INTO POLYPEPTIDES THAT ARE APPROXIMATELY THE SAME SIZE. THE MATURE PROTEIN IS COMPOSED OF A SINGLE POLYPEPTIDE CONTAINING ONE OR INTRA-MOLECULAR DISULFIDE LINKAGES.
-i- SIMILARITY: BELONGS TO THE 2S SEED STORAGE ALBUMINS FAMILY.
                                                                                                                                                                                                                                                                                  Spermatophyta; Magnoliophyta; Embryospermatophyta; Magnoliophyta; eudicotyledons; Asteridae; euasterids II; Asterales; Asteracon Heliantheae: Heliantheae

A novel 2S cocoa albumin was isolated, purified and identified from cocoa beans. Enymatic hydrolysis of the protein generated a pool of flavor precursors, peptides and amino acids that resulted in formation of cocoa flavor upon heating with sugars. The DNA encoding a precursor cocoa 2S protein was isolated from immature Theobroma cocoa seeds.

PRIORITY APPLN. INFO.: DE 2000-10053519 A 20001027 The invention relates to an expression cassette for expression of foreign genes in the embryonic epidermis and/or the flower of plants. The cassette uses the promoter of the mybll gene of Arabidopsis thaliana or functional equiv. or equiv. fragments thereof that have substantially the same promoter activity, said promoter being operably linked with a nucleic acid sequence that is to be transgenically expressed. The invention further relates to vectors derived from said expression cassettes. invention also relates to transgenic plants transformed with said expression cassettes or vectors, to cultures, parts or transgenic propagation material derived therefrom and to the use thereof for producing foodstuff, feedstuff, seeds, pharmaceuticals or fine chems.

Grain texture in barley is an important quality character as soft-textured cultivars have better malting quality. In wheat, texture is considered to be detd. by the puroindolines, a group of basic hydrophobic proteins present on the surface of the starch granule. Hard wheats have been proposed to lack puroindoline a or to have mutant forms of puroindoline b which do not bind to the granule surface. Anal. of six barley cultivars (three soft-textured and three hard) showed that all contained proteins homologous to wheat puroindoline b, but PCR anal. failed to show any differences in amino acid sequences similar to those which have been proposed to det. textural differences in wheat. Southern blot anal. showed two hordoindoline b genes which were isolated and shown to encode proteins with 94% sequence identity. Expression of hordoindoline b mRNA occurred in the starchy endosperm and aleurone layer of the developing seed, but not in the embryo. Anal. of seven soft- and six hard-textured barley varieties showed that all contained hordoindoline a except two hard varieties (Sundance, Hart) which were subsequently shown to both lack hordoindoline a mRNA. It was therefore concluded that there is not a clear relationship between the presence of hordoindoline a and grain texture in barley.

AΒ The present invention provides DNA mols. that constitute fragments of the genome and cDNAs from Zea mays mays (HYBRID SEED #35A19) and Arabidopsis thaliana (ecotype Wassilewski), and polypeptides encoded thereby. mols. are useful for specifying a gene product in cells, either as a promoter or as a protein coding sequence or as an UTR or as a 3' termination sequence, and are also useful in controlling the behavior of a gene in the chromosome, in controlling the expression of a gene or as tools for genetic mapping, recognizing or isolating identical or related DNA fragments, or identification of a particular individual organism, or for clustering of a group of organisms with a common trait. Arabidopsis DNA is used in the present expt., but the procedure is a general one. Protocols are provided for Southern hybridizations and transformation of carrot cells. [This abstr. record is one of 15 records supplemental to CA13316218528Q necessitated by the large no. of index entries required to fully index the document and publication system constraints.].

      A modified glutenin or seed-storage protein is modified by adding to the
      protein a domain which confers to the modified protein the ability to
      incorporate into gluten or bind a ligand or other macromol.
      Thus, the gene selected to construct vectors for such fusion proteins
     coded for C hordein, a storage protein from barley endosperm and characterized by an absence of cysteine residues. Lipid-binding domains were constructed from (1) barley oleosin, (2) wheat CM16 or CM17
      proteins, or (3) puroindoline A; a starch-binding domain was
      obtained from glucoamylase of Aspergillus niger. The modified fusion
      proteins were expressed in recombinant wheat. Such proteins have uses in
      the prepn. of food products or non-food products.

      Walnuts rank third in per capita consumption of tree nuts in the United
      States and can be assocd. with systemic IgE-mediated reactions in some
      individuals. The objectives of the study were to clone a gene encoding
      one of the major food allergens in the walnut kernel and to characterize
      the recombinant allergen. A cDNA expression library in the lambda vector Uni-ZAP, which was prepd. from walnut somatic embryos, was screened by
      using a patient's sera that reacted with multiple protein bands on
      immunoblotting. A cDNA clone contg. an insert of 663 bp was identified
      and named Jug r 1. DNA sequence anal. of this clone revealed that it
      encoded a protein 142 amino acids in length. Comparison of the encoded
      protein sequences with protein databases revealed that this clone exhibits
```

a 46.1% identity with the Brazil nut (Bertholletia excelsa) methionine-rich 2S albumin seed storage protein precursor, Ber e 1. Jug r 1 appears to be an important walnut food allergen; 12 of 16 sera from patients allergic to walnuts demonstrated IgE binding to the 2S albumin seed storage protein precursor fusion protein. An IgEbinding inhibition study suggests that the walnut 2S protein precursor undergoes posttranslational modification into a large and small subunit that is similar to castor seed, cottonseed, mustard seed, and Brazil nut 2S seed storage protein allergens. Interestingly, the gene encoding this allergenic protein in Brazil nuts has recently gained notoriety because of its exptl. use as a transgene to enhance the nutritional quality of legumes. This is now the sixth definitive 2S albumin seed storage protein demonstrated to bind IgE, suggesting that this class of proteins is inherently allergenic.

PR AΒ Disclosed is an amylase inhibitor consisting of a protein constructed of 244 amino acid residues having two subunits each identified as SEQ ID NO:1, in which a single band is obsd. at a mobility of 0.26 by polyacrylamide gel electrophoresis, and having a high inhibitory activity against human pancreatic .alpha.-amylase to inhibit an increase in blood glucose level, control an insulin secretion or maintain the duration in a feeling of satiety for diet. The amylase inhibitor can be used alone or in combination with other known amylase inhibitors.

AΒ An agent for inhibiting an accumulation of visceral fat is disclosed which comprises an amylase inhibitor of wheat origin as an active ingredient. Rats contg. 2.4% amylase inhibitor in their diet for a period of 2 wk consumed the same amt. of food and weighed the same at the end of the expt. as did the control group. However, the epididymal and mesenteric adipose tissue wt. was significantly less in the expt. group. Addnl., the activities the lipogenic enzymes fatty acid synthetase, malate dehydrogenase, and glucose-6-phosphate dehydrogenase were lower in the exptl. group.

Effect of long-term inhibition of intraluminal .alpha.-amylase activity on eating and the small intestinal mucosa was investigated in growing male Wistar rats. The rats were fed the wheat amylase inhibitor (AI) for 21 days, and each AI rat was paired with control rats. Chronic ingestion of the wheat AI significantly decreased food intake, reduced wt. gain and did not alter stool output. After feeding of the wheat AI over 21 days, the entire length of the small intestine was not changed. However, chronic AI decreased the mucosal wt., protein and DNA contents of the upper small intestine by reducing food intake and wt. gain (an overall nutritional effect). By contrast, in the distal intestine, AI significantly increased mucosal wt., RNA and activities of disaccharidases (sucrase, maltase and lactase); this effect likely represents ileal adaptation to increased amts. of undigested and unabsorbed carbohydrate delivered to the distal intestine. These effect of the wheat AI suggest that it may be useful to treat obesity, diabetes mellitus or both conditions.

DOCUMENT TYPE: Journal LANGUAGE: English

Cell fractionation of pulse-chase-labeled developing pumpkin cotyledons demonstrated that proprotein precursor to 2S albumin is transported from the endoplasmic reticulum to dense vesicles and then to the vacuoles, in which pro2S albumin is processed to the mature 2S albumin. Immunocytochem. anal. showed that dense vesicles of about 300 nm in diam. mediate the transport of pro2S albumin to the vacuoles. The primary structure of the precursor (16 578 Da) to pumpkin 2S albumin has been deduced from the nucleotide sequence of an isolated cDNA insert. The presence of a hydrophobic signal peptide at the N-terminus indicates that the precursor is a preproprotein that is converted into pro2S albumin after cleavage of the signal peptide. N-terminal sequencing of the pro2S albumin in the isolated vesicles revealed that the signal peptide is cleaved off co-translationally on the C-terminal side of alanine residue 22 of prepro2S albumin. By contrast, post-translational cleavages occur on the C-terminal sides of asparagine residues 35 and 74, which are conserved among precursors to 2S albumin from different plants. Hydropathy anal. revealed that the two asparagine residues are located in the hydrophilic regions of pro2S albumin. These findings suggest that a vacuolar processing enzyme can recognize exposed asparagine residues on the mol. surface of pro2S albumin and cleave the peptide bond on the C-terminal side of each asparagine residue to produce mature 2S albumin in

DOCUMENT TYPE: Journal LANGUAGE: English

Three cDNA clones from barley developing endosperm, corresponding to proteins BTAI-CMa, BTAI-CMb and BTAI-CMd, which are the three types of subunits of the tetrameric inhibitor of insect .alpha.-amylases, have been identified and sequenced. The deduced amino acid sequence of BTAI-CMb corresponds to the CM16/CM17 type of subunit in wheat (92/90% identical residues) and has on putative N-glycosylation site (NLT) and a possible kinase-C phosphorylation site (SCR). The BTAI-CMa sequence differs at four acid residues from a previously reported one from cv. Bomi and the sequence deduced for BTAI-CMd completes (11 N-terminal residues) and confirms previously available data. The gene for BTAI-CMa (Iat1) is located in the .beta. arm of barley chromosome 7H (syn.1), while genes for both BTAI-CMb (Iat2) and BTAI-CMd (Iat3) are in the long arm of chromosome 4H. The three genes are expressed in endosperm and their mRNAs are not detected in the other tissues tested, except Iatl, which seems to be expressed at a low level in coleoptile and roots, where it is switched off by 50 .mu.M Me jasmonate.

DOCUMENT TYPE: Journal LANGUAGE: English

Two genes, BE2S1 and BE2S2, coding for methionine-rich albumins of Brazil nut (B. excelsa) have been cloned and their sequence detd. The genes are members of a multigene family and BE2S1 codes for one of the dominant 2S isoforms. Its expression is highly regulated during seed development and with respect to tissue specificity. Sequence anal. has shown that the genes contain one intron and that the promoter of BE2S1 shows a canonical TATA motif. The transcription initiation site is located 26 nucleotides downstream from the TATA box. Sequence comparison of the promoter regions of 2S genes from Brassica napus, Arabidopsis thaliana and B. excelsa revealed the presence of TCGA palindromic sequences that appear to be arranged in a 2S-specific manner.

Three cDNA clones, encoding napin storage proteins from radish, were isolated and sequenced. They fall into two classes differing in the size of the primary translation product. Sequences of the two classes are very well conserved and they display an organization very similar to that of the homologous genes from rapeseed and Arabidopsis which have previously been described. On the basis of hybridization intensity and the no. of restriction fragments, the authors est. that the radish napin multigene family is represented by eight to twelve members. The use of probes specific to each subfamily demonstrates that they contribute to a similar extent to the prodn. of napin mRNA. Anal. of the sequence data suggests that the napin ancestral genes are probably derived from successive duplication and divergence of a protogene. Comparing other available napin sequences with those of radish reveals intriguing features. Comparison of the coding sequences shows that the homol. between the radish and rapeseed sequences is much higher than that between each of the four members of the Arabidopsis gene family. This would suggest that the duplications which gave rise to the different members occurred independently in the two groups of species after sepn. of Arabidopsis from the Brassica lineage. However, a similar comparison carried out on the 3'-noncoding sequences does not support this hypothesis, but shows that slightly different duplicated genes probably already existed in the common ancestor to the three genera. This paradox can be resolved by assuming that, within each genus, coding sequences for napin-encoding genes have been considerably homogenized as a result of concerted evolution.

The R. communis (castor bean) 2S albumin is a heterodimer of glutamine-rich, disulfide-linked 4- and 7-kDa polypeptides. A cDNA library was constructed using mRNA from maturing castor bean endosperm as template. Clones contg. sequences complementary to albumin mRNA were isolated by hybridization using as a probe a mixt. of synthetic oligonucleotides representing sequences predicted for a peptide present in the 2S albumin large subunit. The nucleotide sequence contained an open reading frame encoding a preproprotein of 258 amino acid The preproprotein included both polypeptides of the previously sequenced 2S albumin. In addn., this precursor included 2 further glutamine-rich sequences which, in terms of their size and conserved

cysteine residues typically found in seed proteins of the 2S albumin superfamily, possibly represent the small and large polypeptide subunits of a 2nd heterodimeric storage protein. A post-translational processing scheme is proposed which would result in a single preproprotein generating two distinct heterodimeric 2S albumins. The generation of a 2nd heterodimer seems likely since polypeptide candidates for its small and large subunits were found in the Ricinus 2S albumin fraction, and N-terminal protein sequencing confirmed the existence of the putative small subunit.

CODEN: JIMMBG; ISSN: 0022-1759

DOCUMENT TYPE: Journal LANGUAGE: English

An ELISA method for the rapid detn. of IgE-binding sites (allergenic determinants) of proteins is reported. The method utilizes the epitope mapping kit (H. Geysen et al., 1984) to synthesize hexapeptides of an allergen of interest, followed by a biotin-avidin system to detect peptide-bound IgE. The technique allows rapid localization of determinants from allergens of known sequnce without the need to purify large amts. of allergen nor to generate peptides by cleavage of it. Using the results of the epitope mapping expts., a putative allergenic peptide contg. 18 amino acid residues from the sequence of a wheat allergen (.alpha.-amylase inhibitor) was identified and synthesized on polyamide resin. Testing of this peptide by radioallergosorbent test inhibition showed that it bound specific IqE in the sera of patients allergic to wheat.

CODEN: MGGEAE; ISSN: 0026-8925

DOCUMENT TYPE: Journal LANGUAGE: English

CORPORATE SOURCE:

A cDNA encoding trypsin inhibitor CMe from barley endosperm was cloned and characterized. The longest open reading frame of the cloned cDNA codes for a typical signal peptide of 24 residues followed by a sequence which is identical to the known amino acid sequence of the inhibitor, except for an Ile/Leu substitution at position 59. Southern blot anal. of heat-barley addn. lines has shown that chromosome 3H of barley carries the gene for CMe. This protein is present at <2%-3% of the wild-type amt. in the mature endosperm of the mutant Ris.vphi. 1508 with respect to Bomi

barley, from which it has been derived, and the corresponding steady-state levels of the CMe mRNA are .apprx.1%. One or 2 copies of the CMe gene (synonym Itcl) per haploid genome have been estd. both in the wild type and in the mutant, and DNA restriction patterns are identical in both stocks, so neither a change in copy no. nor a major rearrangement of the structural gene account for the markedly decreased expression. The mutation at the lys3a locus in Ris.vphi. 1508 has been previously mapped in chromosome 7 (synonym 5H). A single dose of the wild-type allele at this locus (Lys 3a) restores the expression of gene CMe (allele CMe-1) in chromosome 3H to normal levels.

The most abundant isoform of the 2S albumin present in seeds of A. thaliana was sequenced and the corresponding gene isolated. Examn. of the protein and DNA sequences allows the detn. of the exact proteolytic cleavage sites during posttranslational processing. Like other 2S albumins, that of Arabidopsis is made as a prepropeptide. After removal of the signal peptide, the propeptide is cleaved at 4 other points, giving 2 subunits linked by a disulfide bridge(s). Comparison of these cleavage sites with those of 2S albumins of Brassica napus and Bertholletia excelsa suggests that while individual cleavages sites between species are conserved, the 4 processing sites within a species are not similar. This suggests that up to 4 different proteases may be involved in processing 2S albumins. The Arabidopsis 2S albumin gene was used to isolate the entire gene family. There are 4 genes, tightly linked in a tandem array. None of the genes contains an intron. Comparison of the predicted protein sequences shows that only 1 of the genes encodes the isoform detd. by protein anal. to be the most abundant, and therefore this gene is certain to be expressed. It is possible that some or all of the other 3 genes are also active.

The amino acid sequence of barley trypsin inhibitor was detd. The protein was a single polypeptide consisting of 121 amino acid residues and had a mol. wt. of 13,305. No free SH groups were detected by Ellman's reagent,

which indicated the presence of 5 disulfide bridges in the mol. The primary site of interaction with trypsin was tentatively assigned to the arginyl-leucyl residues at positions 33 and 34. On comparison of the sequence of this inhibitor with those of other proteinase inhibitors, it was found that barley trypsin inhibitor could not be classified into any of the established families of proteinase inhibitors and that this inhibitor should represent a new inhibitor family. On the other hand, this trypsin inhibitor showed considerable similarity to wheat .alpha.-amylase inhibitor throughout the whole sequence, suggesting a common ancestry for both proteins. This is the 1st case of a possible evolutionary relation between 2 inhibitors directed to totally different enzymes, a proteinase and a glycosidase.
